Grass growth is 19 kg DM/ha/day above the 10 year average and is • forecast to remain ahead due to mild the weather conditions.

01-Mar 01-Apr 01-May 01-Jun 01-Jul 01-Aug 01-Sep 01-Oct 01-Nov

- The final grazing rotation should be well underway in line with an autumn rotation plan with a targeted rotation length of 40 days.
- Avoid the temptation to re-graze paddocks grazed from the start of ٠ October. 80% of grass grazed in the spring is grown in October.
- Use strip grazing, spur roadways, multiple entry and exit points and ٠ on-off grazing to maximise grass utilisation and increase days at grass.
- Achieving good grazing residuals in the final rotation will improve ٠ grass quality in the spring.

6.6 kg DMI. Maintenance=35 MJ/day, 40 MJ/kg gain
